Shuo REN

Email: sren@cse.cuhk.edu.hk · renshuo139@gmail.com

PhD researcher building long-horizon, tool-grounded LLM agents for complex engineering workflows. Research spans multi-agent physical-design optimization, failure-conditioned repair, and automatically generated evaluation environments, grounded in verifiable EDA and mathematical-optimization tools.

Internship & Education

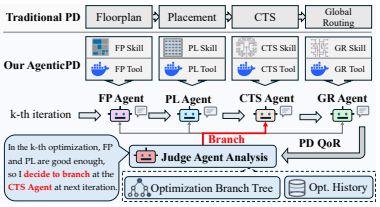

Research Intern, EDA Research Lab, Hong Kong Science Park May 2026–Present
Developing agentic 3D-IC workflows that couple LLM agents with industrial physical-design tools and feedback for partitioning and design-space exploration.

Research Collaboration, ABCO Project (CUHK Industry Collaboration) Mar 2025–Apr 2026
Built the physical-design-to-architecture feedback loop behind CLIP-3D, connecting analytical 3D floorplanning with gem5, McPAT, CACTI, and HotSpot.

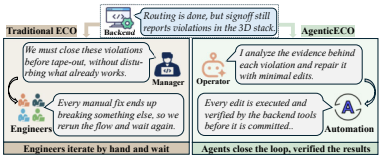

The Chinese University of Hong Kong (CUHK) Sep 2024–Present
PhD in CSE, full postgraduate studentship; working with Prof. Tsung-Yi Ho and Prof. Bei Yu

Huazhong University of Science and Technology (HUST) 2020–2024
BEng in Computer Science and Technology; GPA 3.93/4.00, top 1.5%; **National Scholarship of China**

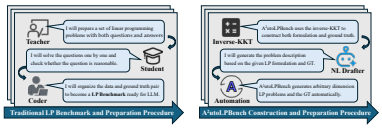

Selected Agent Research

AgenticPD [link] [code] formulated chip physical-design optimization as a stage-aware tree search rather than flat parameter tuning or one-shot script generation. Built a hierarchical harness where a Judge Agent navigates reusable intermediate design states and stage agents act through stage-scoped tools with structured execution feedback and context management; evaluated across six design/technology combinations.

AgenticECO [link] [code] formulated post-route ECO for 3D-IC chip design as failure-conditioned agentic repair. Typed timing, routing, layout, and violation evidence drives deterministic repair programs executed outside the LLM. Every edit must pass immutable DRC, timing, structural-equivalence, and preservation gates; the closed loop cleared 7/9 matched cases versus 2/9 for stock repair and 9/9 in a cross-backbone rerun.

A^{2}utoLPBench [link] [code] replaced fixed LP corpora with an inverse-KKT generator and an agent-runnable Docker environment producing unlimited problems with certified optima and tunable difficulty. Across five frontier models, the solver–critic loop achieved a best gain of 15.1 percentage points on MAMO Complex, with repeatable trajectories and audited token costs.

EDA Research Background

Partitioning-Free 3D-IC Floorplanning [paper], removed up-front netlist partitioning and jointly optimized block placement and die assignment under physical constraints; accepted at ASP-DAC 2026.

CLIP-3D [link], connected gem5, McPAT, CACTI, HotSpot, and analytical 3D floorplanning to expose thermal, wire, and cache effects during architecture exploration; improved realized BIPS by 13.75% on average across thermally binding configurations; featured as an Agentic 3D-IC case study in an IDAS 2026 keynote.

Chiplet3D [link], embedded exact pin transformations and a convolutional 3D thermal field in a MILP floorplanner; reduced wirelength by 39–43% on average and peak temperature by up to 45.9°C versus prior baselines.

Technical Stack

Agent/LLM: Python; tool-use and multi-agent systems; structured tool APIs; Docker evaluation harnesses; trajectory, failure, and token-cost analysis; AI-native development with Claude Code and Codex.

EDA/Systems: C/C++, Linux, Git; OpenROAD/ORFS and Innovus; physical design, STA, and 3D-IC workflows; gem5, McPAT, CACTI, and HotSpot.
